Part 1			
In Part 1, we are looking to de the equipment.	efine how much waste concrete ne	eeds to be handled, and ho	ow quickly it needs to be washed thru
For example, if you wash out then if you need to wash 1 ful	1 yard per day, it is different if you ha I yard at once.	ave 6 to 8 washouts of 3-5	cubic feet each, every 2-3 hours,
It is also different if you need 1-yard total from multiple buc	to washout 1 yard at once (end of da kets or vehicles.	ay, for example) from 1 mu	d bucket or ready-mix truck, versus
For each answer, list current	and anticipated future amounts, if ap	plicable.	
a. How much total wa	aste concrete is washed o	out per day? Maximi	um worst-case day
NOW:		FUTURE:	
b. How many wash-o	uts per day?		
NOW:	t	FUTURE:	
c. How often do wash	1-Outs occur?	FUTURE:	
d. Approx. time betwe	een wash-outs?	FOTONE.	
NOW:	Jen wash odis:	FUTURE:	
e. Largest amount at	one time?		
NOW:		FUTURE:	
f. Describe in more d	etail, if needed: (elaborate w/	sales rep if needed)	
washout and left-over concr a. Please check the i [check ALL that ap	` '	you have already had, if are how you handle y	
We had a recl	aimer, but it is no longer i	n service.	
We washout ir	nto a settling pond or bun	ker.	
We pour block	s or other forms.		
We discharge (or haul it away to	• ,	w), let the concret	e harden, and then crush the materia
Other (define/	describe): (elaborate w/ sales re	ep if needed)	

Part 2 - continued

If you checked either of the first 2 boxes above, please answer questions 2b through 2d. Otherwise, please skip to question 2e below.

b. Please describe your Reclaimer: [manufacturer, make and model if known. Otherwise, type: i.e. auger/screw, paddle wheel, bucket wheel, drag chain, et							
c. How many years is/w	as the reclaim	er in operation:					
d. We were generally Please explain:	satisfied	unsatisfied	with this reclaimer? (Please check one.)				
Skip to this point if you have ne	ver used a reclaimer	at this location.					
•	•	•	ically, what type(s) of equipment need to be ucks, Placement Vehicles (aka "Tuckers®"), etc.				
f. Do you have any exist	ting settling po	nds or washout	t pits? Please attach dimensioned sketch or drawing.				
g. After you washout, w Rock/Coarse Agg:	here do the so	lids go?					
Sand/Fine Agg:							
Cement:							
h. Where does the wate	r go?						
_		•	gn(s). By defining the materials and particle sizes, ure the slurry handling system will function				

properly.

Please list the approx. % of total mix for each material. For aggregates and fibers, please list particle size.

*NOTE: a sieve analysis of aggregate sizes can be attached as an alternative.

Please leave blank any material not used.

MATERIAL	% OF TOTAL MIX		PARTICLE SIZE		
Coarse Aggregate			MAX	MIN	
Fine Aggregate		MAX		MIN	
Fiber				DIA. x LENGTH	
Cement			Please check here if fibers are metal		
Fly Ash			We also use: (check all)		
Silica Fume			Color pigments		
Pozzolan			Air Entrainment		
Other:			Other:		

Part 4
In Part 4 we are trying to determine how you plan on separating the cement from the slurry discharge, and other water issues.
In most installations, cement is separated from the water and disposed of. We'd like to find out how you want to accomplish that. The water is then recirculated back to the reclamation equipment and used to wash more incoming waste concrete. Some users wish to use excess water back at the plant. Please check any/all of the following that you have interest in using:
□ <u>Settling Ponds</u>
Settling ponds are the most common method. They must be long enough to allow sufficient settling time to get the cement to fall out of the slurry/water stream. You also need to be able to clean the settled solids out (front-end loader, skid-steerer or hoe). They should be deep enough to allow some stockpiling to minimize the frequency of clean-outs. Flocculants (discussed below) help to settle solids more quickly, thereby allowing smaller or fewer ponds.
□ Flocculants and Flocc Feeders
Flocculants can provide benefits to a multitude of separation methods. If used with settling ponds, generally the ponds can be made shorter, or you won't need as many, as the flocculants will settle the cement out much more quickly than gravity alone.
Flocculants will also pull solid color pigments out of the slurry stream. Additionally, many of the heavy metals will be encapsulated in the flocc particles, thereby removing them from the water. Other benefits to Flocculants include larger particle sizes of waste cement (will pass a Paint Filter test, important for landfill disposal) and dryer material, typically allowing the user to stockpile the waste cement in a bunker without the fear of it "mucking up" again when it gets wet.
Flocculants actually scrub the pump and plumbing clean of built-up cement, minimizing plugging and repairs, and can also aid devices such as filter presses, by making them more efficient.
□ <u>Mechanical Separation</u>
Our Model S3 Slurry Separation Stand, in conjunction with the AFD flocculant dispenser, pumps flocked cement slurry up to a tank, where the cement settles out. Clean water is delivered back to the reclaimer, while the settled solids are collected in a dewatering bag for disposal.
□ <u>pH Adjustment</u>
pH adjustment systems using readily available CO ₂ , to lower pH to acceptable levels for release (where allowed), for use in future batches, or for use as yard water (stockpile cooling or dust suppression).
□ <u>Other:</u>
Other technologies, such as filter presses, or define:
Please list or explain any other issues, concerns or requirements you may have:

Please answer as completely as possible, and return to us.
