Twin Shaft Mixer MAO
QUALITY SYSTEM:
The Manufacturing Procedures used for all SICOMA Mixers have been compliant with the Quality Requirements of ISO 9001 since 1995 and have been updated and approved by CERMET since 2009 as compliant to ISO 9001:2008.

3-D MODELLING
Since 1999 all Mixers are designed and constantly improved with the use of three-dimensional modeling softwares.

CNC MACHINE CENTER
The steel fabrication of the mixer tank is machined with a CNC boring machine to guarantee the perfect alignment and parallelism of the mixing shafts.

ASSEMBLY LINE
The Mixers are line assembled giving very short lead times due to the high level of standardisation.

PATENTS
The Shafts’ Seals as well as other particular features are protected by International Patents.
EXTRA-RIGID TANK

The stiffened frame of the tank eliminates the risk of deformation during the transport (also in container) as well as during the full load operation and guarantees the correct planarity of the shafts’ seals. The metal frame for aggregates hopper and the scales can be laid right on the mixer without additional supports.

MIXING ELEMENTS

The mixer tank is lined with Ni-Hard Cast Iron of 530HB minimum hardness. The mixing arms, with a low profile to avoid material build up, are made in Spheroidal Cast Iron. The mixing blades are made in Ni-Hard Cast Iron of 530HB minimum hardness. The large number of blades, their position and their orientation guarantee the right combination between the effects of rolling and circulation of the material during the mixing action.

SHAFT SUPPORTS AND SEALS

The modular support patented by SICOMA is made with two separate housings. The bearing is lubricated in long lasting oil bath. The seal, based on the exclusive system of the counter-rotating disks, is lubricated with liquid grease under controlled pressure.
ALARM BOX

The mixer is equipped with several sensors: thermal sensors for the motors and for the gearboxes, level gauges for the oil of the gearboxes and for the hydraulic power pack, level and pressure sensors for the automatic lubrication system. Upon request, Sicoma can supply the Black Box, an electronic system that records type, number and duration of possible anomalies and alarms during the operation of the mixer. The same device can be programmed for the preventive maintenance.

GEARBOXES

The gearboxes of the mixing group are epicyclical type. The first reduction is carried out by a pulley transmission equipped with a constant-velocity universal joint to keep the shafts synchronised. The low input speed to the gearboxes allows the lubrication oil to work at low thermal load. The connection between the gearbox and the tank is made with the exclusive Swing Out Drive, this unique option for SICOMA Twin Shaft Mixers was developed over the last years to make any maintenance to the shaft supports easier and faster. The full drive assembly (Motor, Pulleys and Gearbox) is hinged to the side of the mixer tank and it can be swung out easily without the need of cranes or any lifting device. In case of unplanned maintenance, the downtime for the plant is minimized, resulting in a extremely low maintenance cost.

HYDRAULIC POWER PACK

The closing of the door is guaranteed by the pressure sensor included in the hydraulic circuit. In case of failure or blackout, a manual pump can be operated for the emergency discharge and closure.

AUTOMATIC LUBRICATION

The grease needed by the seal to keep the counter-rotating surfaces lubricated is given by four (4) independent automatic pumps that keep a constant pressure into the housing. They uniformly and accurately dispense the necessary quantity of grease and guarantee a low grease consumption (less than 0.03kg/h) together with an low contamination of the mixing.

TOP COVER

The high top cover (500mm) is equipped with two hinged hatches and does not have any post. It allows an easy access to the mixer for an accurate cleaning at the end of the shift or for both preventive and unscheduled maintenance resulting in a shorter shutdown of the plant.
INSPECTION PLATFORM

The inspection platform with stairs, included in the supply, is absolutely necessary for the safe inspection and maintenance of the mixer. Its effective modular design allows the installation to be extremely easy without the need of any crane or winch.

DISCHARGE DOOR

The discharge door has a rubber seal that runs along its full perimeter. The eccentric rotation of the door sector guarantees that the rubber seal is always reached and compressed despite its wear and tear.

WIDE RANGE OF MIXERS

The size of SICOMA Twin Shaft Mixers ranges from 1 to 8 cubic meters of compacted concrete output, covering every need of our customers in terms of production capacity. The excellent performance is recognized in several applications: production of ReadyMix Concrete, production of prestressed / precast elements, RCC concrete for dams, soil stabilization, but also in different sectors such as the inertization, waste treatment and chemical products.

Depending on the type of application, the mixers can be equipped with several accessories and options to optimize their productivity, mixing quality and life expectancy. Whenever necessary, we work with our customers to develop new solutions that best suit their specific needs.
STANDARD ACCESSORIES
All MAO mixers are supplied with the following standard accessories:
- Liner Plates and Mixing Blades in Ni-Hard Cast Iron
- Swing Out Drivers
- Mixing Arms in Cast Iron, bolted to the shafts
- High Top Cover with Inspection Hatches and Ports
- Inspection Platform with stairs
- Wiring of all auxiliary devices to a IP55 Junction Box
- Alarm Box with related sensors and probes.
- Automatic Grease Lubrication System with electric pump and sequential distributor
- Wrench kit for the mixer maintenance
- Safety Key Transfer Lock for accident prevention.

OPTIONAL ACCESSORIES
The mixers MAO can be equipped with the following accessories upon request.
- Discharge Chute
- Dust Collector Bag (Airbag)
- Double speed for the skip ascent and descent
- Pre-assembled Feeding system with aggregates holding hopper, cement scale, water scale, complete with the holding frame laying on the four sides of the mixer tank.
- Special customization for dams and large RCC projects

ACCESSORIES OPTIONS AVAILABLE

SKIP HOIST
The loading skip for the aggregates is available for the MAO mixers up to the size 6000/4000. The hoist has two grooved drums on the same shaft. The skip cable has an anti free-fall block in case of cable failure while two limit switches constantly check its tension. Upon request, the double speed for ascent and descent is available, as well as an inverter based controller to customize speed at its best.

HIGH PRESSURE WASHOUT
Two high pressure water pipes are placed above the shafts with as many nozzles as the number of arms. These spray bars are operated by a gearmotor and rotate so that the jets reach every spot for an effective cleaning. The washout has to be carried out at the end of each mixing cycle and the waste water is used for the next mixing.

BLACK BOX
The standard Alarm Box, usually supplied as a standard, can be replaced by the Black Box to record and process all signals coming from the several sensors and some signals from the control panel. The detection and record of the alarms have to support the operator in the maintenance of the mixer, by giving specific reminders on the regular maintenance set in the factory on the basis of the statistics on the mixers. The data can be downloaded using the two USB ports which allow the connection of memory devices (such as USB memory sticks) and the connection to a personal computer.

LOW MOTION DRIVE
This option is based on an auxiliary motor which can rotate the shafts at low speed. By using a button switch, the mixer can be driven safely also with the inspection doors open. The cleaning as well as the regular maintenance (such as the periodic adjustment of the blades) are simplified and faster. The Control Panel for the Low Motion Drive is not included. We propose the Manual Control Panel of the Mixer which includes all devices to operate the Low Motion Drive.

MANUAL CONTROL PANEL
The mixer can be equipped with the Manual Control Panel which can operate the mixer in Manual Mode with the following buttons: Start/Stop of the mixer motors, Open/Close Discharge Door and Emergency Stop. This Panel can also operate the Low Motion Drive, if present.

REDUCED DISCHARGE DOOR
The reduced size of the discharge door allows the use of a small discharge chute. As a consequence, the supporting structure of the mixer can be shorter compared with the standard twin shaft mixers.

BOMB BAY DOOR
All SICOMA Twin Shaft Mixers can be equipped with the Bomb Bay Door which allows the bottom of the mixer tank to be opened for nearly half of its surface. The discharge is extremely fast also in case of low slump concrete. This option is particularly important in case of RCC production and loading on dump trucks.

DOUBLE DISCHARGE DOOR
The mixer can be equipped with two independent discharge doors to pour the concrete in two different places. One of the limitations of the twin shaft mixers is then overcome.
